INVESTIGATION REPORT

600 BTC Dormant-UTXO Activation and Subsequent Split

CASE	case-ff40b602e629
PRIMARY TRANSACTION	5337…1607
OBSERVED	22 September 2026
REPORT VERSION	Evidence Sheet V2
PREPARED	15 October 2026

CASE **case-ff40b602e629**	**TECHNICAL BLOCKCHAIN INVESTIGATION**	**NO ENTITY ATTRIBUTION ESTABLISHED**

EXECUTIVE FINDINGS

A concise view of confirmed facts, observed transaction structure and unresolved attribution.

600 BTC	~14.2 YEARS	35 INPUTS	2 x ~300 BTC	2 TERMINAL
Principal dormant value	Oldest material UTXOs	Consolidated to one output	Near-equal split	UTXOs unspent at checked tip

CONFIRMED Seven economically material UTXOs created in July 2012 and totaling exactly 600 BTC were activated in September 2026.

OBSERVED The funds consolidated into native SegWit, moved approximately one hour later, split almost equally, and one branch moved once more.

UNRESOLVED Controller identity, beneficial ownership, purpose, custody involvement and whether the movement represented a sale.

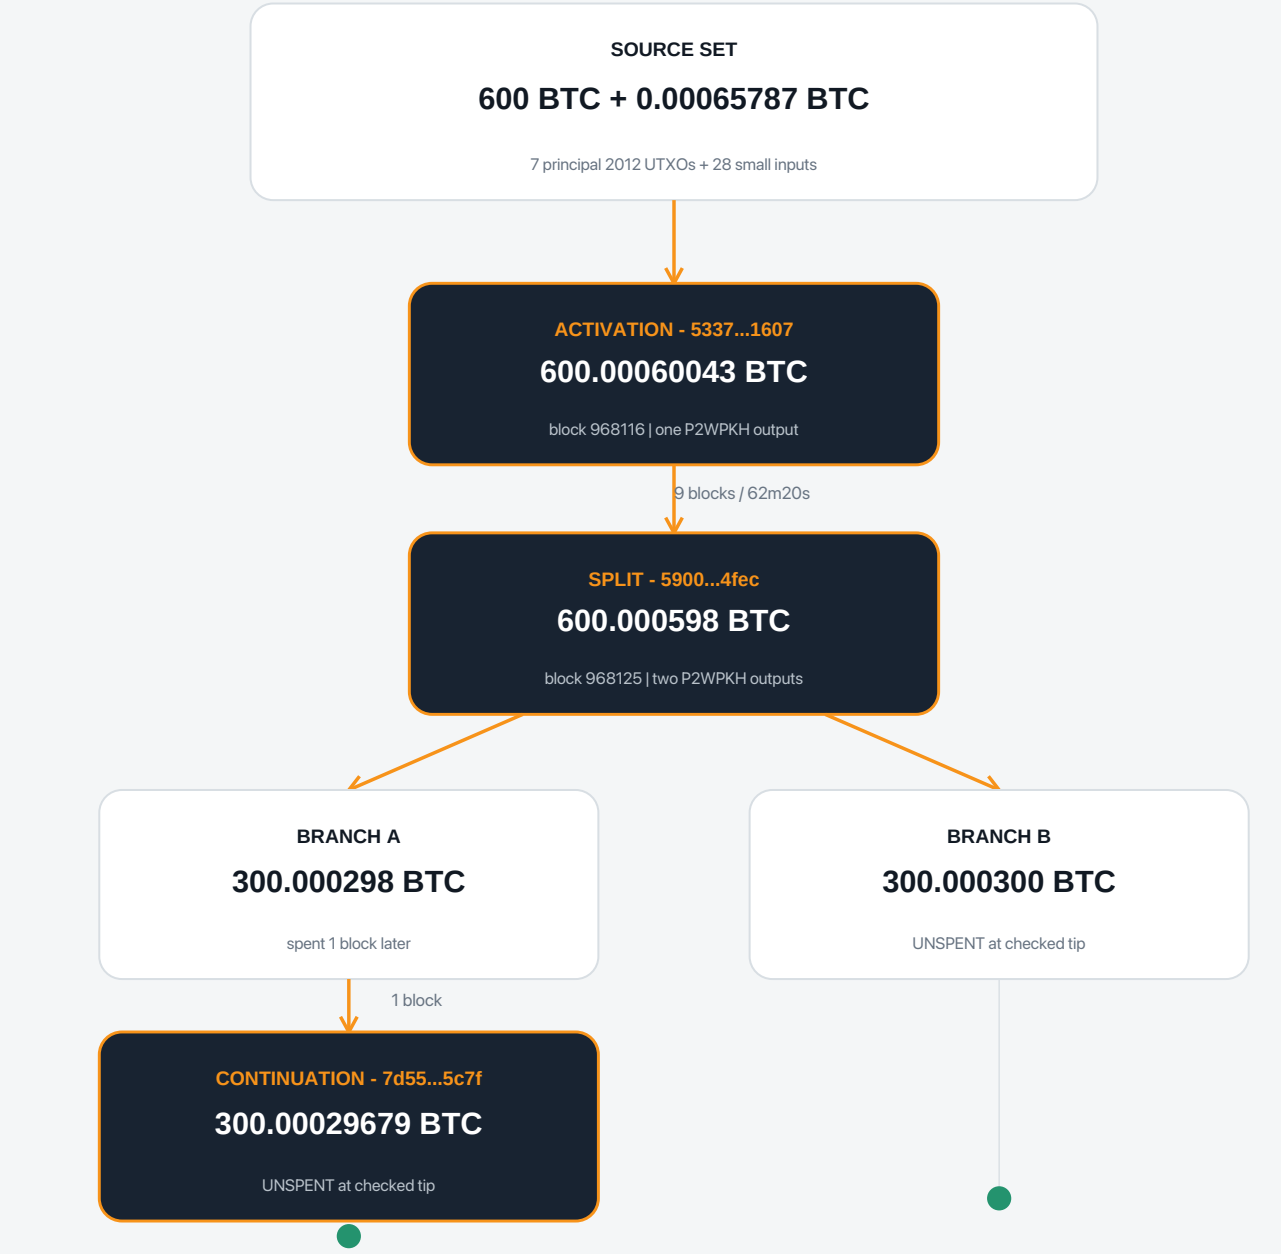

WHAT THIS REPORT DOES NOT ESTABLISH

- Beneficial owner
- Controller identity
- Common ownership of downstream addresses
- Exchange deposit
- Custodian involvement
- Sale of BTC
- Criminal activity
- Purpose of movement

SECTION 00

Verified transaction flow

The diagram uses only established outpoint links and verified values. It does not imply different owners for the two branches.

ATTRIBUTION BOUNDARY

Connected transactions establish fund flow. They do not establish beneficial ownership, controller identity, sale, custody involvement or a change in control.

SECTION 01

Case summary

FIELD	FINDING
Case ID / status	case-ff40b602e629 / ESCALATED
Primary transaction	5337...1607 (full txid in Appendix C)
Block / time	968116 / 2026-09-22T07:22:20Z
IDMON observation	2026-09-22T07:22:42.492Z
Activation accounting	35 inputs: 600.00065787 BTC | one output: 600.00060043 BTC | fee: 0.00005744 BTC
Source	1K6vURxUuK6uUCeXxk31PCyDahAu1raunh | legacy P2PKH
First destination	bc1q3h4r0ps8u3vh0vz80rt69gnmvp70d3c4e3uaqa | P2WPKH
Dormancy	Oldest 5,182 days | approximately 14.2 years
IDMON classification	Possible Cold Storage Move
Severity / score	Event severity HIGH (6) | intelligence score 56 / HIGH

Seven economically material Bitcoin UTXOs created between 14 and 16 July 2012, totaling exactly 600 BTC, were spent on 22 September 2026. Twenty-eight additional small inputs contributed 0.00065787 BTC. The activation consolidated all 35 inputs into one native-SegWit output.

Nine blocks later, the output was divided into two near-equal branches. One branch moved again in the next block. At checked Core height 971565, both terminal outputs remained unspent. The evidence establishes transaction flow, not actor identity, purpose, service involvement or changed beneficial ownership.

SECTION 02

Scope and methodology

This V2 report is a presentation pass over the completed Evidence Sheet V1. It adds no evidence and changes no factual or interpretive conclusion.

Evidence came from existing IDMON archives and read-only verification against the local Bitcoin Core node. No external attribution source was used.

The checked node was synchronized to mainnet height 971565, pruned with prune height 930649, and had no txindex. Retained blocks allowed exact reproduction of the activation and descendant path. Verbosity-3 data for block 968116 exposed spent prevout values, scripts and creation heights through undo data. Full historical parent transaction bodies for the 2012 UTXOs could not be retrieved locally.

METHOD Deterministic blockchain evidence, stored IDMON labels, observed structures, heuristic interpretations and unresolved attribution are separated throughout.

SECTION 03

Source UTXO analysis

OUTPOINT	BTC	BLOCK	TIMESTAMP
6d251795...61137:1	200	189076	2012-07-14 20:51:42Z
7760d357...6d565:1	200	189205	2012-07-15 17:12:54Z
40a5c27c...a7ef2:1	100	189205	2012-07-15 17:12:54Z
9011daff...a21df:1	50	189205	2012-07-15 17:12:54Z
09cc0f4f...4f340:1	25	189205	2012-07-15 17:12:54Z
1bf0f6f1...05861:1	15	189206	2012-07-15 17:14:13Z
0ca8e981...eb2ed:1	10	189357	2012-07-16 17:49:23Z
TOTAL	600		

The 28 additional inputs totaled 0.00065787 BTC. All 35 prevouts used the same P2PKH address and script. Their inclusion in a valid transaction demonstrates spending control sufficient to spend those UTXOs. It does not establish legal or beneficial ownership, controller identity or common control of downstream addresses.

Dormancy profile

METRIC	RESULT
Oldest input age	5,182 days
Value-weighted average	5,182 days
Simple average	2,678 days
Inputs aged at least 180 days	34 of 35
IDMON label / formatted age	HISTORIC / 14.2y

The value-weighted age is dominated by the seven 2012 UTXOs, which account for exactly 600 BTC of the total input value.

SECTION 04

Transaction timeline

STAGE	BLOCK / TIME	TRANSACTION AND FLOW	CLASS
Dormant source	189076-189357 14-16 Jul 2012	Seven principal outpoints total 600 BTC; 28 small inputs total 0.00065787 BTC	ON_CHAIN_FACT
Activation	968116 2026-09-22 07:22:20Z	5337…1607: 600.00065787 BTC in; one 600.00060043 BTC output; fee 5,744 sats	ON_CHAIN_FACT
Near-equal split	968125 2026-09-22 08:24:40Z	5900…4fec: outputs 300.000298 and 300.0003 BTC; fee 243 sats	ON_CHAIN_FACT
One-branch continuation	968126 2026-09-22 08:41:35Z	7d55…5c7f: 300.000298 BTC in; 300.00029679 BTC out; fee 121 sats	ON_CHAIN_FACT
Terminal state	Core height 971565	300.0003 BTC and 300.00029679 BTC unspent; total 600.00059679 BTC	ON_CHAIN_FACT

SECTION 05

Fund-flow accounting

```
Activation inputs 600.00065787 BTC
Less activation fee 0.00005744 BTC
Less split-transaction fee 0.00000243 BTC
Less continuation fee 0.00000121 BTC
----------------------------------------
Terminal unspent outputs 600.00059679 BTC
```

RECONCILED Total verified fees are 0.00006108 BTC. Input value less all verified fees equals the two terminal UTXOs exactly.

The split outputs differed by 0.000002 BTC / 200 sats before one branch incurred its subsequent fee. Their near equality provides no deterministic basis for identifying either output as change.

SECTION 06

Script and address behaviour

The activation spent 35 legacy P2PKH prevouts associated with one address and produced one native-SegWit P2WPKH output. The split and continuation also produced P2WPKH outputs.

OBSERVED_PATTERN The P2PKH-to-P2WPKH transition is compatible with wallet migration, key rotation or operational restructuring. It does not prove those explanations or common downstream control.

The retained IDMON history contained no earlier exact-address occurrence for the first destination. The first destination was observed once as recipient and once as spender. The first split address was observed once as recipient and once as spender. The terminal addresses were observed as outputs only.

SECTION 07

IDMON intelligence findings

STORED OUTPUT	FINDING	EVIDENTIAL TREATMENT
Classification	Possible Cold Storage Move	IDMON_EXISTING_LABEL; meaning is HEURISTIC_INFERENCE
Event severity	HIGH; score 6	IDMON_EXISTING_LABEL
Intelligence score	56 / HIGH	IDMON_EXISTING_LABEL
Signal	LARGE_UNKNOWN_TRANSFER; initially MODERATE; confidence 0.64	IDMON_EXISTING_LABEL
Signal	NEW_DESTINATION; initially MODERATE; confidence 0.63	IDMON_EXISTING_LABEL
Block-level signal	DORMANT_COIN_ACTIVITY; HIGH; confidence 0.87	Aggregate label; not exclusive to this transaction
Wallet profile	relay_node; dormant_mover; possible_custody	Heuristic tags; no prior behavioral baseline

> Large structured movement with many inputs and few outputs. Likely custody or treasury-style transfer.

The quoted text is IDMON's stored interpretation and is treated as HEURISTIC_INFERENCE. The transaction structure is confirmed; custody or treasury involvement is not.

SECTION 08

Evidence assessment

FINDING	EVIDENCE CLASS	BASIS
Seven July 2012 UTXOs total exactly 600 BTC	ON_CHAIN_FACT	Exact outpoints, values, heights and header times
35-input activation; one-output consolidation	ON_CHAIN_FACT	Retained block 968116
Exact 5,744-sat activation fee	ON_CHAIN_FACT	Input-output accounting and Core fee field
Later near-equal split	ON_CHAIN_FACT	Exact outputs in block 968125
One-branch continuation	ON_CHAIN_FACT	Exact spend link in block 968126
Terminal UTXOs unspent at checked tip	ON_CHAIN_FACT	UTXO-set verification at height 971565
Dormant activation and consolidation	OBSERVED_PATTERN	Confirmed timing, values and structure
P2PKH-to-P2WPKH script migration	OBSERVED_PATTERN	Confirmed script types
Short downstream continuation	OBSERVED_PATTERN	Nine-block spend and one-block continuation
Possible cold-storage move	IDMON_EXISTING_LABEL / HEURISTIC_INFERENCE	Stored classification; no direct custody evidence
Controller, owner, purpose, sale and service involvement	UNRESOLVED	No validated attribution or off-chain evidence
Complete upstream transaction history	UNRESOLVED	Pruned source blocks and no txindex

ON_CHAIN_FACT

OBSERVED_PATTERN

HEURISTIC_INFERENCE

SECTION 09

Alternative explanations

The available evidence does not support ranking one explanation above another.

ALTERNATIVE	COMPATIBILITY	EVIDENCE NEEDED TO DISTINGUISH
Wallet migration	P2PKH consolidation into P2WPKH is compatible with format migration.	Wallet records, derivation evidence, signed messages or documented control.
Key rotation	Consolidation and redistribution can accompany a signing or key-management change.	Authenticated operational records, signed control proofs or key-management documentation.
Self-transfer	Value conservation apart from fees is compatible with a common controller.	Reliable common-control evidence, wallet metadata, signed messages or documented clustering.
Custody restructuring	Large consolidation and later division can occur operationally in custody systems.	Validated custodian labels, attributable records, public disclosure or direct confirmation.
Treasury restructuring	Near-equal allocation and one-branch continuation can occur in internal treasury operations.	Attributed organizational wallets, treasury records or independently verified disclosures.
Ownership transfer	Transfer to a different controller is technically compatible with the path.	Legal, contractual, counterparty or payment evidence showing changed beneficial control.

SECTION 10

Attribution assessment

No supported entity label exists for the source or any verified destination. No exchange or custodian attribution is established. No external attribution provider, API, website or public-source claim was used.

Same-address input control does not establish legal or beneficial ownership. Connected downstream addresses cannot be assumed to share an owner. The terms cold storage, custody, treasury and relay are used only as stored IDMON labels or cautious structural hypotheses.

WHAT THIS REPORT DOES NOT ESTABLISH

Beneficial owner; controller identity; common ownership of downstream addresses; exchange deposit; custodian involvement; sale of BTC; criminal activity; purpose of movement.

SECTION 11

Evidence provenance

The principal IDMON sources were the compact Bitcoin transaction archive, the 22 September full event archive, case memory, publishing decisions, and existing label/entity files. Deterministic verification used read-only Bitcoin Core block, header and UTXO-set methods.

Another investigator using a node retaining blocks 968116-968126 can reproduce the activation and descendant flow. A full archival source is required to reproduce the complete parent transaction bodies for the 2012 UTXOs. Exact source references and the reproducibility checklist are in Appendix C.

SECTION 12

Limitations

- Historical source blocks are below the checked node's pruning boundary.
- The node lacks txindex and cannot return complete historical source transaction bodies.
- No immutable raw-RPC evidence bundle or cryptographically checksummed package exists.
- No source or destination has validated entity attribution.
- No deterministic change heuristic identifies either split branch as change.
- IDMON wallet-profile tags lacked a prior behavioral baseline.
- UTXO status is point-in-time at checked height 971565.
- Absence of an IDMON label does not prove an address has never been attributed elsewhere.

SECTION 13

Unresolved questions

01	Who controlled the source script at activation?
02	Were the source and any destination addresses under common control?
03	Why was the 600 BTC moved after approximately 14.2 years?
04	Why was the output split approximately equally?
05	Why was one branch forwarded once?
06	Will either terminal output move after the checked tip?
07	Do the terminal outputs eventually interact with a reliably labelled service?
08	Was any service or custodian involved despite the absence of an IDMON label?
09	Did beneficial control change at any point?
10	What is the complete historical provenance of the seven 2012 UTXOs?

SECTION 14

Professional assessment

PROFESSIONALLY CREDIBLE	MISSING VS. MATURE TOOLING
Exact transaction dissection	Full graph history
UTXO accounting	Broader defensible clustering
Dormant-coin analysis	Attribution databases
Follow-on tracing	Service/exchange exposure
Bitcoin Core corroboration	Immutable evidence bundles
Evidence-class discipline	Investigator audit trail
Uncertainty handling	External attribution provenance

The case is suitable for a narrowly scoped technical portfolio investigation if its attribution boundaries remain prominent. It is not sufficient for claims about who controlled the funds, why they moved or whether they were sold.

SECTION 15

Conclusion

NARROW CONCLUSION

The evidence establishes that seven economically material Bitcoin UTXOs created in July 2012 and totaling exactly 600 BTC were spent in September 2026 as part of a 35-input consolidation. The resulting output moved again approximately one hour later, split into two near-equal branches, with one branch subsequently forwarded once. At the checked Bitcoin Core tip, approximately 600 BTC remained in two unspent outputs. The available evidence does not establish the identity of the controller, the purpose of the movement, an exchange deposit, a sale or a transfer of beneficial ownership.

TECHNICAL APPENDIX A

Checked tip: height 971565, hash 00000000000000000000a8af2e400541ac68205ffb317213c4604aa927f8f074.

IDMON sources

- data/archive/btc-transactions.ndjson - stored transaction facts and intelligence fields
- data/archive/events.ndjson.2026-09-22T12-52-38-709Z.full - original archived event and signals
- data/case-memory.json - exact transaction case membership
- data/publishing/editorialDecisions.ndjson - dry-run publishing decision
- labels.json and data/entity-memory.json - exact-address label checks

Reproducibility checklist

- [ ] Locate the primary archive record by exact txid without reclassification.
- [ ] Confirm case membership using exact txid fields in case memory.
- [ ] On a node retaining block 968116, retrieve it with verbosity 3.
- [ ] Confirm all 35 prevout outpoints, values, creation heights and scripts.
- [ ] Confirm the 600.00065787 BTC input sum, one output and 5,744-sat fee.
- [ ] Retrieve blocks 968125 and 968126 and verify exact input-outpoint links.
- [ ] Confirm the split, continuation and their 243-sat and 121-sat fees.
- [ ] Query 5900…4fec:1 and 7d55…5c7f:0 in the current UTXO set and record the checked tip.
- [ ] Reconcile input value, total fees and terminal UTXO value.
- [ ] Record reproduction-time labels separately from the archive-time record.
- [ ] Preserve raw RPC responses and checksums if producing a later evidence package.

NODE LIMITATION

The checked node was pruned at height 930649 and had no txindex. Activation and descendant blocks were retained. Full historical parent transaction bodies for the 2012 UTXOs could not be reproduced from that node.
